

Glanville have a respected reputation in road traffic accident investigation, where highway matters are considered to be contributory factors. Our engineers have frequently been called as expert witnesses in legal proceedings arising as a result.

Factors associated with highway design, maintenance and construction are often claimed to have been instrumental in causing motor accidents. Many individual matters can, either on their own or in combination, be of significance. We have specialised experience in the investigation of the influence of these matters.

Our skills help insurers, highway authorities and private individuals in determining whether the design, construction or maintenance of the highway were in any way causative factors in the development of motor accidents.

Vital information can be lost if the scene is not inspected shortly after the accident. If our appointment is delayed for some time roads may have been re-surfaced, signs changed, drainage modified and even the alignment altered before we visit the scene. Our value to clients is, therefore greatly enhanced if we are given early instructions.

Even if some considerable time has elapsed our services are almost always of value to clients if an accident involved significant personal injury and there was any suggestion that a highway related matter might have been a causative factor.

We undertake detailed investigations from which we prepare carefully argued reports and when necessary we act as Expert Witnesses for litigation.
